(54) Title: METHOD OF MANUFACTURING A COMPOSITE MATERIAL

(57) Abstract

The invention relates to a method of manufacture of a composite product comprising at least one layer of reinforced woven material and at least one layer of PTFE foil or ePTFE foil, where the foil or foils are laminated together with the layer or layers of woven material under the use of heating and pressurising, where the composite material subsequently is cooled to a fully or partly fixed state. According to a preferred embodiment the composite is fixated by means of one or two co-operating pressure surfaces under a relative high pressure. By the invention a form stabile composite material having a considerably enhanced E-module is achieved.

Method of manufacturing a composite material

Background art

The invention relates to a method of manufacture of a
5 composite material according to the introductory part of
claim 1, a composite product according to the
introductory part of claim 9 and an apparatus for
performing the method according to the introductory part
of claim 11.

10

Composite products comprising a reinforcing woven
material and a PTFE foil are used for many different
industrial purposes. Within the chemical industry, this
kind of material is for example used for vessels,
15 compensators, containers, conveyor belts and chemical
barriers in general that must be able to resist strong
chemical and thermal impacts. This is likewise the case
within power plants, the food industry and many other
applications where reliable and strong mechanical and/or
20 chemical properties are also important.

In a composite material of the above kind the interaction
between materials in the composite will create the
properties that makes the composite material suitable for
25 a given application. Typically, the woven material will
improve the mechanical properties during a thermal impact
whilst the applied PTFE foil or foils will constitute
barrier properties that can be maintained even under high
temperatures.

30

However, it has proven difficult to obtain a proper
"balance" between the individual components of the
composite material during its manufacture. This is

because a composite product typically shrinks relatively much during the manufacturing, so that the final end composite product displays significantly different dimensions than those of the original laminated product.

5 This is in particular a problem in relation to the manufacture of composite products with pre-determined end dimensions, just as there is a tendency for the composite product to bend or wrinkle particularly in the edge regions.

10

Apart from the problem in itself that the composite shrinks or in other ways are disfigured, it is also a problem that it can be difficult to predict which dimensions the end product actually obtains. This results
15 often in that the composite product, where it is possible, must be machined further after the lamination. This further treatment such as machining results in material waste just as it most often is not possible to carry out the further treatment of a product in an
20 automated manner.

Furthermore, it must be mentioned that the material waste as a result of the shrinkage of the material in itself is so high that it is a significant factor in the final
25 production price. An laminated assembly to composite product of the above kind can shrink with more than 10 %.

A way of improving the manufacturing process is by adding to the woven material an extra layer of coating on the
30 opposite side of the provided lamination of PTFE foils.

This solution however makes the manufacturing process more expensive in itself, results in an increased use of

material, and finally results in that the finished composite materials are increased in thickness and weight.

5 Disclosure for the invention

By, as disclosed in claim 1, to cool the composite material subsequently to a fully or partly fixed state, a composite material with an improved form stability, reduced shrinkage and an enhanced E-module is obtained.

10

By reducing the shrinkage for the PTFE of the composite, a better form stability for the product as a whole is hereby obtained, since the woven material typically is very sensitive to shrinkage by lamination with a foil.

15

The main purpose, that is to obtain an improved form stability, is thus a very important factor in connection to a precision produce of composite products, conduit linings, compensators, conveyor belts, tank liners, containers or similar applications, where a poor form stability results in that the finished product shrinks with a relative large and not fully determined percentage.

20 This is also the case where the composite materials, in for instance chemical plants, is combined with form stabile components with known dimensions, since it can be tremendously difficult to predict the dimensions of the finished composite product.

30

A fixation of the composite could as an example be carried out by expanding the composite in a frame, and then carry out a cooling by the use of a gas or a liquid.

By the invention it is preferred to let the cooling take place as quickly as possible after the heating.

5 By a reinforcing woven material is understood for instance glass fibre fabric, PTFE fabric, PTFE coated glass fibre fabric or other materials. However it is preferred in many applications to use glass fibre fabric. By a ePTFE foil is meant an expanded PTFE foil.

10

According to the invention, by fixation in full or partly of the composite during the cooling, it is further possible to regulate or control the shrinkage of the finished product. This is of major importance in relation
15 to products where high dimensional requirements are requested of the end product. A part of the cooling process can for instance be carried out in a fixed state, whilst another part of the cooling process can be carried out in a non-fixed state.

20

It is understood that the invention can be carried out as a sub-process of a total process, since it is possible to manufacture a composite material with one added layer of foil and fabric at the time, so that a multi-layered
25 composite material can be manufactured by laminating one layer to the composite at the time.

Besides there is achieved the significant advantage that the finished composite material according to the
30 invention in itself exhibits a significantly reduced shrinkage of the end product relative to the added foils and fabrics, which means that the utilisation degree can be enhanced by at least 10 %.

Moreover, a major trimming of the edge regions can be avoided, whereby the waste of material in this relation is reduced.

5

By, as described in claim 2, to let the cooling be carried out over a period of time of approximately 0.1 to 240 seconds from a temperature of 300 to 420 °C to a temperature of about 50 °C, an advantageous and practical
10 embodiment of the invention is achieved.

It is preferred for many of the used material thickness that the time period is approximately 20 to 120 seconds from a temperature of 380 to 400 °C to a temperature of
15 about 50 °C.

It is understood that the time and cooling process is very dependent on the thickness and the properties of the individual components.

20

It should be emphasised that the cooling can be done rather quickly, whereby the combined cooling and fixation is very attractive in connection with automatic and continuous manufacturing processes.

25

It is further understood that improved results can be achieved by performing a cooling according to the invention over a part of a temperature interval, just as it is understood that the best result, however, first
30 will be achieved when cooling over the whole temperature interval, i.e. from a given high temperature to a wanted end temperature.

By, as described in claim 3, to let the composite material be subject to a tension during the cooling, an advantageous embodiment of the invention is achieved.

- 5 By, as described in claim 4, that the composite material undergoes a combined cooling and pressure operation by means for pressure application, an advantageous embodiment of the invention is achieved, since the means for pressure supply fixates the composite material during
10 the cooling, which results in a solid improvement of the form stability. Specifically, a particularly high E-module can be achieved for the final composite product, just as a good form stability is achievable. This means for instance that the shrinkage of a composite material
15 manufactured according to the invention will be significantly reduced. By certain types of products the shrinkage can be reduced with a factor 10-15 and the E-module can be enhanced by a factor 5.
- 20 The achieved fixation by means for pressure supply also means that the composite can be cooled during a very high pressure, as the composite hereby is fixated in a controlled manner during the entire cooling. This high cooling pressure results firstly in that the form of the
25 composite is maintained during the cooling in its final shape, and secondly that the cooling takes place much more quickly across the surface. An improved contact between the means for pressure supply and the composite thus leads to an improved mutual heat transport, whereby
30 the cooling of the composite can be accelerated.

By, as described in claim 5, that the means for pressure supply is provided with cooling means, a particularly

advantageous embodiment of the invention is achieved, since it has been discovered that this combined cooling and pressure application results in an optimal result with respect to the produced composite materials.

5 Firstly, a product with improved shrinkage properties is achieved, secondly, the product can be produced with a relative uncomplicated control.

As mentioned above, an improved contact between the means
10 for pressure supply and the composite thus results in an improved mutual heat transfer whereby the cooling of the composite can be accelerated.

By, as described in claim 6, that the pressure supply is
15 provided continuously by means for pressure supply comprising at least one roller, there is established a commercially advantageous possibility of providing a continuous production of a form stabile composite material and/or a high E-module.

20

The production can further be carried out in a relative high speed.

By, as described in claim 7, that the pressure supply is
25 provided intermittently by means for pressure supply comprising a pressure surface, there is achieved a particular advantageous embodiment of the invention, as the pressure supply applied by a pressure plate can be completely controlled in the sense that any supplementary
30 tension in the foils or the surface direction of the composite in many applications can be totally avoided.

The pressure supply can be provided by controlling only one parameter, i.e. the pressure provided by the means for pressure supply. By using this pressure surface it is avoided that the diffusion properties are influenced uncontrollably by simultaneous tension in the foils or the composite.

As a pressure surface is in this connection for instance understood a plate, just as a pressure surface can be in the shape of a form.

It is preferred according to the invention to use a relative high surface pressure, since the fixation thereby becomes better during the cooling. As an example a pressure of 0.1 - 20 N/mm² can be used.

A high surface pressure on the composite material during the cooling will result in improved material properties both with respect to the form stability and performance, just as shrinkage in the flow direction in the continuous process is reduced, as the composite due to the use of a pressure plate also is held in its longitudinal direction during the cooling.

By, as described in claim 8, that the composite material is cooled under a substantively uniform pressure over the surface by a cooling surface, a possibility is achieved to obtain a composite material having uniform shrinkage properties over the entire surface.

30

By, as described in claim 9, that the product comprises at least one foil layer of PTFE or ePTFE foil and at least one layer of reinforcing woven material, a product

is achieved possessing a high E-module and other advantageous material properties.

A further advantage by a composite product of the above
5 mentioned kind is that the edge properties become improved considerably, as a reduced shrinkage of in particular materials that consist of for instance a layer of PTFE foil laminated without the use of the teaching according to the invention would have a tendency to curl
10 or "wrinkle" in the edges of the composite product. This disadvantage is partly equalised by the improvement of the shrinkage properties, that is less shrinkage, just as the fixation of the composite during the cooling improves the resulting form stability overall in the product - and
15 thereby also in the edge sections.

By, as described in claim 10, that the reinforcing woven material consists at least partly of glass fibre fabric or PTFE coated glass fibre fabric, a particular
20 advantageous embodiment of the invention is achieved. The invention has proven itself particular advantageous with respect to the relative high sensibility compared with a laminated PTFE foil. It has proven possible to produce composite products, e.g. discrete components, endless
25 webs of the composite etc., without that the dimensions of the final products divert substantively from the original form of the composite in its non-final state.

Under all circumstances it is possible according to the
30 invention to obtain a larger degree of predictability with respect to the shrinkage.

The drawings

In the following, the invention is further described under reference to the drawings, where

5 fig. 1 shows a preferred embodiment of the invention, and where

fig. 2 shows a further embodiment of the invention.

10 Preferred embodiment

In figure 1 a schematic view is shown of a preferred automated embodiment according to the invention.

15 In the viewed embodiment, the shown apparatus is fed by endless webs of PTFE foil 1 and PTFE coated glass fibre fabric 2 from a roll of PTFE foil 3 and a roll of PTFE coated glass fibre fabric 4. The finished composite 9 is wound up on a roll 10.

20 According to the viewed embodiment the webs 1 and 2 perform a relative movement relative to the apparatus and the rollers 3, 4 and 10 are rotated by not shown forwarding means in an intermittent movement in between two co-operating heated pressure surfaces 5 and 6. These
25 pressure surfaces 5, 6 are in the shown embodiment connected to not shown hydraulic pressure- and movement means and adapted to perform a relative movement to and from the two webs 1 and 2.

30 The above stepwise movement in the longitudinal direction essentially corresponds to the pressure surfaces 5, 6.

When the stepwise movement has fed two new partial lengths of foil 1 and glass fabric 2 in between the pressure surfaces 5, 6, the pressure plates 5, 6 will move against the webs and perform a combined pressure and
5 heat treatment so that the foil 1 and the glass fabric is joined together in a lamination.

According to the viewed embodiment, the foil and the glass fabric is heated to a temperature of approx. 380°C
10 - 400°C under a pressure of 0.1-20 N/mm².

When the lamination is completed the pressure surfaces 5, 6 are moved away from each other and the now laminated composite is moved in an intermittent movement in between
15 two co-operating cooling means.

The cooling means will over a time period of 20 - 120 seconds cool the composite to a temperature of about 50°C and applying a pressure of 0.1 - 20 N/mm².
20

When the lamination of the partial length is completed the pressure surfaces are moved apart and the composite web is rolled up on a roll.

25 It is understood that the above described process is a continuous process where a cooling of a partial length is carried out simultaneous with the heating of the preceding partial length.

30 It is moreover understood that the different process parameters can be adjusted and optimised to the properties and thickness of the chosen materials.

It is thus within the scope of the invention to vary the temperature and the time intervals with respect to the applied materials and the wanted result.

- 5 It is likewise understood that the composite also could be applied a multiple of lamination and glass fibre fabric layers until the wanted thickness and the wanted material properties are achieved.
- 10 In fig. 2 a further embodiment of the invention is shown.

In the shown embodiment the apparatus is fed by endless webs of PTFE foil 1 and a PTFE coated glass fibre fabric 2 from a roll of PTFE foil 3 and a roll of PTFE coated
15 glass fibre fabric 4. The finished composite 9 is wound up on a roll 10.

According to the shown embodiment the webs 1 and 2 perform a relative movement relative to the apparatus and
20 the rollers 3, 4 and 10, that are rotated by means of not shown forwarding means in a continuous movement in between two co-operating heated pressure surfaces in the shape of rollers 15 and 16. These rollers 15, 16 are in the viewed embodiment connected to not shown pressure
25 means.

When the continuous movement has fed the two new partial lengths of the foil 1 and the glass fabric 2 in between the pressure rollers 15, 16, the pressure rollers are
30 moved relative to the webs and apply a combined pressure and heat impact so that the foil 1 and the glass fibre fabric are joint together in a lamination in a continuous movement.

When the relevant part of webs have been moved away of the rollers they are laminated and are forwarded in between two co-operating pressure surfaces 7, 8 that are
5 provided with cooling means.

The cooling means will over a time period of e.g. 0.1 seconds cool the composite to a temperature of about 50°C whilst under pressure.

10

The composite is finally wound up on the roll 10.

It is understood that many different types of apparatuses can be designed for the performance of the invention.

15

As an example thereof, it can be mentioned, that the corresponding pressure surface arrangement displayed in dotted lines could be omitted.

PATENT CLAIMS:

1. A method of manufacture of a composite product comprising at least one layer of reinforced woven material and at least one layer of PTFE foil or ePTFE foil, where the foil or foils are laminated together with the layer or layers of woven material under the use of heating and pressurising,
5
- 10 characterised in that the composite material subsequently is cooled to a fully or partly fixed state.
2. A method according to claim 1, characterised in that the cooling is carried out over a period of time
15 of approximately 0.1 to 240 seconds from a temperature of 300 to 420 °C, preferably 20 to 120 seconds from a temperature of 380 to 400 °C to a temperature of about 50 °C.
- 20 3. A method according to claim 1 or 2, characterised in that the composite material is subject to a tension during the cooling.
4. A method according to claims 1-3, characterised
25 in that the composite material undergoes a combined cooling and pressure operation by means for pressure application.
5. A method according to claims 1-4, characterised
30 in that the means for pressure supply is provided with cooling means.

6. A method according to claims 1-5, characterised in that the pressure supply is provided continuously by means for pressure supply comprising at least one roller.

5

7. A method according to claims 1-6, characterised in that the pressure supply is provided intermittently by means for pressure supply comprising a pressure surface.

10

8. A method according to claims 1-7, characterised in that the composite material is cooled under a substantively uniform pressure over the surface by a cooling surface.

15

9. A composite product manufactured according to the claims 1-8, characterised in that the product comprises at least one foil layer of PTFE or ePTFE foil and at least one layer of reinforcing woven material.

20

10. A composite product according to claim 9, characterised in that the reinforcing woven material consists at least partly of glass fibre fabric or PTFE coated glass fibre fabric.

25

11. An apparatus for manufacture of a composite material comprising at least one layer of reinforcing woven material and at least one layer of PTFE foil or ePTFE foil, where the foil or foils are laminated together with the layer or layers of woven material under the use of heating and pressurising, as the apparatus comprises means for lamination of the composite material by a combined pressure and heat supply,

30

characterised in that the apparatus further comprises means for fixation of the uncooled or at least only partly cooled composite material and with said means co-operating controllable cooling means.

5

12. An apparatus according to claim 11, characterised in that the means of the apparatus for fixation and the associated controllable cooling means comprises at least one pressure surface including
10 integrated cooling means.

13. An apparatus according to claim 11, characterised in that the means of the apparatus for fixation and the associated controllable cooling
15 means comprises at least one roller having integrated cooling means.

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

(PCT Article 36 and Rule 70)

Applicant's or agent's file reference P 98 002 WO	FOR FURTHER ACTION See Notification of Transmittal of International Preliminary Examination Report (Form PCT/IPEA/416)	
International application No. PCT/DK98/00342	International filing date (day/month/year) 06/08/1998	Priority date (day/month/year) 06/08/1997
International Patent Classification (IPC) or national classification and IPC B32B27/12		
Applicant KE-BURGMANN A/S et al.		

1. This international preliminary examination report has been prepared by this International Preliminary Examining Authority and is transmitted to the applicant according to Article 36.

2. This REPORT consists of a total of 6 sheets, including this cover sheet.

- ☒ This report is also accompanied by ANNEXES, i.e. sheets of the description, claims and/or drawings which have been amended and are the basis for this report and/or sheets containing rectifications made before this Authority (see Rule 70.16 and Section 607 of the Administrative Instructions under the PCT).

These annexes consist of a total of 16 sheets.

3. This report contains indications relating to the following items:

- I ☒ Basis of the report
- II ☐ Priority
- III ☐ Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- IV ☐ Lack of unity of invention
- V ☒ Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- VI ☐ Certain documents cited
- VII ☒ Certain defects in the international application
- VIII ☒ Certain observations on the international application

Date of submission of the demand 18/02/1999	Date of completion of this report 27. 10. 99
Name and mailing address of the international preliminary examining authority:  European Patent Office D-80298 Munich Tel. +49 89 2399 - 0 Tx: 523656 epmu d Fax: +49 89 2399 - 4465	Authorized officer Giese, H-H Telephone No. +49 89 2399 8488 

**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT**

International application No. PCT/DK98/00342

I. Basis of the report

1. This report has been drawn on the basis of (*substitute sheets which have been furnished to the receiving Office in response to an invitation under Article 14 are referred to in this report as "originally filed" and are not annexed to the report since they do not contain amendments.*):

Description, pages:

1-13 as received on 09/08/1999 with letter of 06/08/1999

Claims, No.:

1-13 as received on 09/08/1999 with letter of 06/08/1999

Drawings, sheets:

1 as originally filed

2. The amendments have resulted in the cancellation of:

- ☐ the description, pages:
☐ the claims, Nos.:
☐ the drawings, sheets:

3. ☐ This report has been established as if (some of) the amendments had not been made, since they have been considered to go beyond the disclosure as filed (Rule 70.2(c)):

4. Additional observations, if necessary:

INTERNATIONAL PRELIMINARY EXAMINATION REPORT

International application No. PCT/DK98/00342

V. Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

Novelty (N)	Yes:	Claims	1-13
	No:	Claims	-
Inventive step (IS)	Yes:	Claims	2,13
	No:	Claims	1, 3-12
Industrial applicability (IA)	Yes:	Claims	1-13
	No:	Claims	-

2. Citations and explanations

see separate sheet

VII. Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

see separate sheet

VIII. Certain observations on the international application

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

see separate sheet

Re Item V Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. The following document (D) is referred to in this communication:

D1: GB-A-1 451 824

2. Prior art does not teach the subject-matter of independent claims 1, 9 and 11. Thus they are regarded to be novel and to meet the requirements of Article 33(2) PCT.

None of the in the international search report cited prior art documents reveal an apparatus, a method or a composite in which means are involved for fixation of the not-cooled composite product before and especially during cooling for reducing shrinkage.

3. In the light of the disclosure in the prior art, the solution proposed by the present application cannot be regarded as involving an inventive step. Therefore, claims 1, 9 and 11 do not meet the requirements of Article 33(3) PCT.

- 3.1. The technical problem to be solved by the present invention was to improve form stability during manufacturing (page 3, lines 6-9).

- 3.2. In order to solve the posed problem, the skilled person would turn to closest prior art document D1 (column 1, line 34 to column 2, line 89; column 3, lines 3-5; examples; figures) where a method for cavity-free manufacturing of laminates is described. A semifinished product is produced from fiber-reinforced material and a textile web material under pressure at a temperature from 150-300 °C. To prevent shrinkage the hot laminate is cooled under pressure. The fibre-reinforced material is selected from the group of several olefin polymers and chlorine-containing polymers such as polyvinyl chloride, polyvinylidene chloride and chlorinated polyolefins and the textile web from

glass fibers mats.

The only difference between closest prior art document D1 and the application is that the latter discloses polytetrafluorethylene whereas D1 also mentions halogenated olefinic polymers but chlorinated olefines instead of fluorinated olefines. This difference appears to be merely a chemical alternative which provides similar advantages towards non-halogenated polymers. Consequently, "the invention consists merely in selecting a small number of chemical compounds from a broad field" (see the Guidelines C-IV, 8.8. C1)(iv) PCT).

- 3.3. Dependent claims 3-8, 10 and 12 do not appear to contain any additional feature which, in combination with the features of any claim to which it refers, meet the requirements of the PCT with respect to novelty and inventive step, because the described manufacturing procedure appears to be merely a well-known alternative producing method (see the Guidelines C-IV, 8.8. C1) PCT).
4. Prior art does not teach or suggest the subject-matter of dependent claims 2 and 13. Thus, they are regarded as to be novel and inventive according to Article 33(2)(3) PCT.
5. The claimed invention appears to be industrially applicable and therefore present application meets the requirements of Article 33(4) PCT.

Re Item VII Certain defects in the international application (form or content)

1. As required by Rule 5.1(a)(ii) PCT, it is appropriate to not merely identify documents D1 to D4 (see page 3, lines 5-7) but also to discuss the relevant background art disclosed therein briefly (see also the Guidelines C-II, 4.4 PCT).
2. As required by Rule 5.1(a)(ii) PCT prior art should not merely be disclosed in the introductory part of the description on pages 1 to 3, but the document(s) should be identified in the description of the background art.

Re Item VIII Certain observations on the international application (clarity)

1. The application does not meet the requirements of Article 6 PCT, because claims 1, 10 and 11 are not clear. The term "partly" renders the scope of the invention unclear, since it is not apparent at the moment
 - to what extend the composite material is "fully or **partly fixed**" during cooling (claim 1);
 - to what extend the composite product is made from "partly" glass fibre fabric (see claim 10: "**partly ... consist**"). Moreover, the term "consist" means in general patent English that the woven material is **exclusively** composed of glass fibre fabric.
 - at what temperature the composite should be when fixed by fixation means (claim 11: "uncooled or at least only **partly cooled** composite material", see also page 4, lines 16-19, page 5, last paragraph).
2. The application does not meet the requirements of Article 6 PCT, because claim 2 is not clear. The wording "from a temperature of 300 to 420 °C, preferably 20 to 120 seconds from a temperature of 380 to 400 °C to a temperature of about 50 °C" renders the scope of the invention unclear, since it is not apparent at the moment which temperature should be achieved after the period of time. For examining reasons the passage on page 5, 2nd and 3rd paragraph are referred to in this communication for issuing an opinion about novelty and inventive step of this claim.
3. The words "about" and "approximately" in relation to numerical values render claim 2 and the corresponding passages in the description (e.g. page 5, 2nd and 3rd paragraph; page 11, line 18; page 13, line 8) unclear (Article 6 PCT, Guidelines C-III, 4.5a PCT).

PCT

REQUEST

The undersigned requests that the present international application be processed according to the Patent Cooperation Treaty.

For receiving Office use only

International Application No. PCT/DK 98 / 00342

International Filing Date 06 AUGUST 1998

Patentdirektoratet

Danish Patent Office

Name of receiving Office and "PCT International Application"

Applicant's or agent's file reference
(if desired) (12 characters maximum)

Box No. I TITLE OF INVENTION

Method of manufacturing a composite material

Box No. II APPLICANT

Name and address: (Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)

KE-Burgmann A/S
Expansion Joints Division
Parkallé 34
6600 Vejen
Denmark

☐ This person is also inventor.

Telephone No.

Facsimile No.

Teleprinter No.

State (that is, country) of nationality:

Danish

State (that is, country) of residence:

Danish

This person is applicant
for the purposes of:☐ all designated
States☒ all designated States except
the United States of America☐ the United States
of America only☐ the States indicated in
the Supplemental Box

Box No. III FURTHER APPLICANT(S) AND/OR (FURTHER) INVENTOR(S)

Name and address: (Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country. The country of the address indicated in this Box is the applicant's State (that is, country) of residence if no State of residence is indicated below.)

Mathiesen, Benny Martin
Gl. Strandvej 1
5500 Middelfart
Denmark

This person is:

☐ applicant only☒ applicant and inventor☐ inventor only (If this check-box
is marked, do not fill in below.)

State (that is, country) of nationality:

Danish

State (that is, country) of residence:

Danish

This person is applicant
for the purposes of:☐ all designated
States☐ all designated States except
the United States of America☒ the United States
of America only☐ the States indicated in
the Supplemental Box☐ Further applicants and/or (further) inventors are indicated on a continuation sheet.

Box No. IV AGENT OR COMMON REPRESENTATIVE; OR ADDRESS FOR CORRESPONDENCE

The person identified below is hereby/has been appointed to act on behalf of the applicant(s) before the competent International Authorities as:

☐ agent☒ common representative

Name and address: (Family name followed by given name; for a legal entity, full official designation. The address must include postal code and name of country.)

R&D Manager

Fremgangsmåde til fremstilling af et komposit materiale

Teknikkens baggrund

Opfindelsen angår en fremgangsmåde til fremstilling af et
5 komposit materiale som angivet i krav 1's indledende del,
et komposit produkt i krav 9's indledende del samt et
apparat til udøvelse af fremgangsmåden ifølge krav 11's
indledning.

10 Komposit produkter omfattende et forstærkende
vævs materiale og et PTFE - folie anvendes til meget
forskellige industriformål. Indenfor den kemiske industri
anvendes materialet således til eksempelvis kar,
15 kompensatorer, beholdere, transportbånd og kemiske
barrierer generelt, der skal kunne modstå kraftige
kemiske og temperaturmæssige påvirkninger. Dette gælder
ligeledes inden for kraftværk, fødevareindustrien samt
mange andre anvendelser, hvor der ligeledes lægges vægt
20 på pålidelige og stærke mekaniske og/eller kemiske
egenskaber.

I et kompositmateriale af den ovenstående type vil de i
kompositten indgående materialer tilsammen give de
egenskaber, der gør kompositten egnet til en given
25 anvendelse. Typisk vil vævs materialet tilføre forbedrede
mekaniske egenskaber under temperaturbelastning, mens det
eller de indgående PTFE-folier vil tilvejebringe
barriere-egenskaber, der kan opretholdes under relativt
høje temperaturer.

30

Imidlertid har det vist sig at være vanskeligt at opnå et
fornuftigt "samspil" mellem de i kompositten indgående
komponenter under fremstillingen af kompositten, da et
kompositprodukt typisk vil krympe relativt meget under
35 fremstilling, således at det endelige slut-
kompositprodukt har væsentligt forskellige dimensioner

CONFIRMATION COPY

end det oprindelige ikke laminerede produkt. Dette er særligt et problem i forbindelse med fremstilling af kompositprodukter med fastlagte ønskede dimensioner, ligesom det må konstateres, at kompositproduktet særligt
5 i randområdetne har tendens til at bøje eller krølle.

Udover at det i sig selv er et problem at kompositten krymper, hvadenten det drejer sig om en formindskelse eller forlængelse, er det ligeledes et problem, at det
10 kan være vanskeligt at forudse hvilke dimensioner slutproduktet egentligt opnår. Dette medfører typisk, at kompositten, hvor det er muligt, skal bearbejdes yderligere efter lamineringen. Denne yderligere forarbejdelse giver dels anledning til materialespild,
15 ligesom det som oftest ikke er muligt at foretage den videre forarbejdning af et produkt automatiseret.

Yderligere skal det anføres, at materialespildet som resultat af materialets krympning i sig selv er så højt,
20 at det spiller en væsentlig faktor i den endelige produktionspris. En sammenlamineret komposit af den ovennævnte type kan krympe mere end 10%.

En måde at forbedre fremstillingsprocessen er at tilføre
25 vævsmaterialet et ekstra lag coating på den modsatte side af de pålaminerede PTFE-folier.

Denne løsning er imidlertid fordyrende for fremstillingsprocessen i sig selv, medfører et større
30 materialeforbrug, og medfører endeligt, at de færdige kompositmaterialer bliver forøgede i tykkelse og vægt.

Opfindelsens baggrund

Ved, som angivet i krav 1, at afkøle kompositmaterialet
35 efterfølgende helt eller delvist i en fikseret tilstand,

opnås et kompositmateriale med en større formstabilitet, reduceret krympning og et forøget E-modul.

5 Ved at nedsætte krympningen for det i kompositten indgående PTFE, opnås dermed en bedre formstabilitet for det samlede produkt, da vævsmateriale typisk er meget følsomt overfor krympning ved laminering med et folie.

10 Det overordnede formål, dvs. at opnå en forbedret formstabilitet, er således en meget væsentlig faktor i forbindelse med en præcisionsudførelse af kompositkomponenter, rørgennemføringer, kompensatorer, transportbånd, tankliners, beholdere eller lignende anvendelser, hvor en manglende formstabilitet medfører,
15 at det færdige produkt krymper med en relativ stor, men ikke helt fastlagt, procentdel.

20 Dette gælder eksempelvis også, hvor kompositmaterialer i eksempelvis et kemisk anlæg skal kombineres med formstabile komponenter med kendte dimensioner, idet det kan være særdeles svært at "gætte" dimensionerne på det færdige kompositprodukt.

25 En fiksering af kompositten kan eksempelvis foretages ved at udspænde denne i en ramme, og efterfølgende foretage en afkøling ved hjælp af en luftart eller en væske.

30 I forbindelse med opfindelsen foretrækkes det at lade afkølingen foregå så hurtigt som muligt efter opvarmningen.

Med et forstærkende vævsmateriale forstås eksempelvis glasvæv, PTFE-væv, PTFE coated glasvæv eller andre tilsvarende materialer. Det foretrækkes dog i mange
35 anvendelser at anvende glasvæv. Med et ePTFE-folie forstås et ekspanderet PTFE-folie.

Det er ifølge opfindelsen, ved at fikseres kompositten helt eller delvist under afkøling, ligeledes muligt at styre eller kontrollere krympningen af det færdige produkt, hvilket er meget væsentligt i forbindelse med produkter, der stiller store krav til dimensionerne af slutproduktet. En del af afkølingsforløbet kan eksempelvis foretages i fikseret tilstand, mens en anden del af afkølingsforløbet kan foretages i ikke-fikseret tilstand.

Det er underforstået, at opfindelsen kan udøves som en delproces af en samlet proces, idet det er muligt at fremstille et kompositmateriale med ét adderet lag folie og væv af gangen, således at et flerlags kompositmateriale kan fremstilles ved at laminere ét lag til kompositten af gangen.

Derudover opnås den væsentlige fordel, at det færdige kompositmateriale i sig selv ifølge opfindelsen har undergået en væsentlig mindre formindskelse af slutproduktet i forhold til de tilførte folier og vævsarealer, hvorfor "udnyttelsesgraden" kan forøges med op til mindst 10%.

Derudover undgås en kraftig beskæring af randområderne, hvorfor materialespildet i denne forbindelse reduceres.

Ved, som angivet i krav 2, at lade afkølingen foretages over en tidsperiode på tilnærmelsesvis 0,1 - 240 sekunder fra en temperatur på 300-420 °C til en temperatur på tilnærmelsesvis 50 °C, opnås en fordelagtig og praktiske udførelsesform ifølge opfindelsen.

Det foretrækkes for flere anvendte materialetykkelser, at tidsperioden er på tilnærmelsesvis 20 - 120 sekunder fra

en temperatur på 380-400 °C til en temperatur på tilnærmelses 50 °C.

Det er underforstået, at tids- og afkølingsforløbet
5 afhænger meget af tykkelse og egenskaber af de indgående komponenter.

Det skal dog understreges, at afkølingen kan foretages ret hurtigt, hvorfor den kombinerede afkøling og
10 fiksering er meget attraktiv i forbindelse med automatiserede og kontinuerlige fremstillingsprocesser.

Det er ligeledes underforstået, at der kan opnås forbedrede resultater ved at udøve en afkøling ifølge
15 opfindelsen over et deltemperaturinterval, ligesom det er underforstået, at det bedste resultat dog oftest vil opnås ved afkøling over hele temperaturintervallet, dvs. fra en given høj temperatur, til en ønsket sluttemperatur.

20

Ved, som angivet i krav 3, at lade kompositmaterialet udsættes for et træk under afkølingen, opnås fordelagtig udførelsesform ifølge opfindelsen

25 Ved, som angivet i krav 4, at udsætte kompositmaterialet for en kombineret afkøling og trykpåvirkning af midler til trykpåvirkning, opnås er særlig fordelagtig udførelsesform ifølge opfindelsen, idet midlerne til trykpåvirkning fikserer kompositmaterialet under
30 afkølingen, hvilket medfører en stærkt forbedret formstabilitet. Helt specifikt kan der opnås et særdeles højt E-modul for det endelige kompositprodukt, ligesom der kan opnås en god formstabilitet. Dette medfører eksempelvis, at krympning af et kompositmateriale
35 fremstillet ifølge opfindelsen vil være kraftigt reduceret. I visse produkttyper vil krympningen kunne

reduceres med en faktor 10-15 ligesom E-modulet kan forøges med en faktor 5.

Den opnåede fiksering ved hjælp af midler til trykpåvirkning medfører ligeledes, at kompositten kan afkøles under et meget højt tryk, idet kompositten således bliver fikseret kontrolleret under hele afkølingen. Dette høje afkølingstryk medfører dels, at komposittens form bliver fastholdt under afkøling til sin endelige tilstand, og dels at afkølingen foregå langt hurtigere over fladen. En forbedret kontakt mellem midler til trykpåvirkning og kompositten medfører således en forbedret indbyrdes varmetransport, hvorved afkølingen af kompositten kan accelereres.

Ved, som angivet i krav 5, at udforme midlerne til trykpåvirkning med kølemidler, opnås en særlig fordelagtig udførelsesform ifølge opfindelsen, idet det har vist sig, at denne kombinerede afkøling og trykpåvirkning giver et optimalt resultat i forhold de fremstillede kompositmaterialer. Dels opnås således et produkt med forbedrede krympningsegenskaber, ligesom produktet kan fremstilles under en relativ ukompliceret styring.

Som anført ovenstående vil en forbedret kontakt mellem midler til trykpåvirkning og kompositten således medføre en forbedret indbyrdes varmetransport, hvorved afkølingen af kompositten kan accelereres.

Ved, som angivet i krav 6, at udøve trykpåvirkningen kontinuerligt ved hjælp af midler til trykpåvirkning i form af mindst én valse, opnås en økonomisk fordelagtig mulighed for at foretage en kontinuerlig produktion af et formstabilt kompositmateriale og/eller et højt E-modul.

Fremstillingen kan ligeledes fortages i et relativt højt tempo.

5 Ved, som angivet i krav 7, at udøve trykpåvirkningen
stepvist ved hjælp af midler til trykpåvirkning i form af
en trykflade, opnås en særlig fordelagtig udførelsesform
ifølge opfindelsen, idet en trykpåvirkning udøvet ved
hjælp af en trykflade for det første kan kontrolleres
fuldstændigt i den forstand, at supplerende træk i folier
10 eller komposittens fladeretning i flere anvendelser kan
undgås helt.

Trykpåvirkningen kan således udøves ved styring af kun én
parameter, dvs. trykket udøvet af midlerne til
15 trykpåvirkning. Ved at anvende denne trykflade undgås
således, at diffusionsegenskaberne påvirkes ukontrolleret
ved samtidig trækpåvirkning i folier eller komposit.

Med en trykflade forstås i denne forbindelse eksempelvis
20 en decideret flade, ligesom en trykflade kan udgøres af
en form.

Det foretrækkes ifølge opfindelsen at anvende relativt
høje fladetryk, da fiksering under afkølingen således
25 bliver bedre. Der kan eksempelvis anvendes fladetryk på
0.1 - 20 N/mm².

Et højt fladetryk på kompositmaterialet under afkølingen
vil således give forbedrede materialeegenskaber både med
30 hensyn til formstabilitet og performance, ligesom
krympningen i komposittens fremføringsretning i den
kontinuerlige proces nedsættes, da kompositten som
resultat af anvendelse af en trykflade også fastholdes i
dennes længderetning under afkølingen.

Ved, som angivet i krav 8, at afkøle kompositmaterialet under et i hovedsagen uniformt tryk over fladen ved hjælp af en afkølingsflade, opnås mulighed for at opnå et kompositmateriale, hvis krympningsegenskaber er ens over hele fladen.

Ved, som angivet i krav 9, at lade produktet omfatte mindst ét folielag af PTFE eller ePTFE-folie, samt mindst et lag forstærkende væv, opnås et produkt med et højt E-modul og i øvrigt fordelagtige materialeegenskaber.

En yderligere fordel ved et komposit produkt af den ovenstående art er, at randegenskaberne bliver væsentligt forbedret, da en nedsat krympning af specielt materialer, der består af eksempelvis et lag PTFE-folie sammenlamineret uden udnyttelse af opfindelsens lære, har tendens til at "krølle op" i randen af kompositproduktet. Den ulempe bliver dels opvejet ved at krympningsegenskaberne bliver bedre, dvs. mindre krympning, ligesom fiksering af kompositten under afkølingen forbedrer den resulterende formstabilitet overalt i produkter, og dermed randsektionen.

Ved, som angivet i krav 10, at lade det forstærkende væv udgøres helt eller delvist af glasvæv eller PTFE-coated glasvæv, opnås en særlig fordelagtig udførelsesform ifølge opfindelsen, idet opfindelsen har vist sig særlig fordelagtig i forbindelse med glasvævs relativt store føjelighed i forhold til et sammenlamineret PTFE-folie. Det har således vist sig, at det er muligt at fremstille komposit produkter, dvs. diskrete komponenter, endeløse baner af kompositten etc., uden at dimensionerne af det endelige produkt afviger væsentligt fra den oprindelige form af kompositten i dens ikke-endelige tilstand.

Under alle omstændigheder er det ifølge opfindelsen muligt at få en større grad af forudsigelighed med hensyn til krympning.

5 **Figuren**

Opfindelsen vil i det følgende blive beskrevet under henvisning til tegningen, hvor

fig. 1 viser en foretrukken udførelsesform ifølge
10 opfindelsen, og hvor

fig. 2 viser en yderligere udførelsesform ifølge opfindelsen.

15 **Udførelseseksemplet**

På fig. 1 ses en principskitse af en foretrukken automatiseret udførelsesform ifølge opfindelsen.

Det viste apparat bliver i den viste udførelsesform fødet
20 af endeløse baner af PTFE-folie 1 og PTFE coated glasvæv 2 fra en rulle PTFE-folie 3 og en rulle PTFE-coated glasvæv 4. Den færdige komposit 9 er oprullet på en rulle 10.

25 Ifølge den viste udførelsesform udfører banerne 1 og 2 en relativ bevægelse i forhold til apparatet og rullerne 3, 4 og 10 roteres ved hjælp af ikke viste midler fremføringsmidler i en stepvis bevægelse ind mellem to samvirkende opvarmningstrykflader 5 og 6. Disse
30 trykflader 5, 6 er i den viste udførelsesform forbundet med ikke viste hydrauliske tryk- og bevægelsesmidler og er indrettet til at foretage en relativ bevægelse til og fra de to baner 1 og 2.

35 Den ovennævnte stepvise bevægelse svarer i hovedsagen til trykfladerne 5, 6 i længderetningen.

Når den stepvise bevægelse har ført to nye dellængder af foliet 1 og glasvævet 2 ind mellem trykfladerne 5, 6 vil trykfladerne bevæge sig mod banerne og udøve en kombineret tryk- og varmepåvirkning, således at foliet 1 og glasvævet sammenlamineres.

Ifølge den viste udførelsesform opvarmes foliet og glasvævet til en temperatur på ca. 380°C - 400°C under et tryk på 0.1-20 N/mm².

Når lamineringen er fuldendt vil trykfladerne 5, 6 bevæges fra hinanden og den nu sammenlaminerede komposit vil i en stepbevægelse fremføres ind mellem to samvirkende trykflader 7, 8, der er udformet med kølemidler.

Kølemidlerne vil over en tidsperiode på 20-120 sekunder afkøle kompositten til en temperatur på omkring 50°C og et tryk på 0.1-20 N/mm².

Når lamineringen af dellængden er fuldendt vil trykfladerne 5 og 6 bevæges fra hinanden og kompositten vil blive oprullet på rullen 10.

Det er underforstået, at den ovenfor beskrevne proces er en kontinuerlig proces, hvor en afkøling af en dellængde foretages sideløbende med opvarmningen af en foregående dellængde.

Det er ligeledes underforstået, at de forskellige procesparametre kan justeres og optimeres til de valgte materialers egenskaber og tykkelse.

Det vil således være indenfor opfindelsens rammer at variere på temperatur og tidsintervaller under

hensyntagen til de anvendte materialer og det ønskede færdige resultat.

5 Det er ligeledes underforstået, at kompositten også kan påføres flere laminat- og glasvævslag indtil den ønskede tykkelse og de ønskede materialeegenskaber er opnået.

På fig. 2 ses en yderligere udførelsesform ifølge opfindelsen.

10

I den viste udførelsesform bliver apparatet fødet af endeløse baner af PTFE-folie 1 og PTFE coated glasvæv 2 fra en rulle PTFE-folie 3 og en rulle PTFE-coated glasvæv 4. Den færdige komposit 9 er oprullet på en rulle 10.

15

Ifølge den viste udførelsesform udfører banerne 1 og 2 en relativ bevægelse i forhold til apparatet og rullerne 3, 4 og 10 roteres ved hjælp af ikke viste midler fremføringsmidler i en kontinuerlig bevægelse ind mellem to samvirkende opvarmningstrykflader i form af valser 15 og 16. Disse valser 15, 16 er i den viste udførelsesform forbundet med ikke viste trykmidler.

20

Når den kontinuerlige bevægelse har ført to nye dellængder af foliet 1 og glasvævet 2 ind mellem trykvalserne 15, 16 vil trykfladerne bevæge sig mod banerne og udøve en kombineret tryk- og varmepåvirkning, således at foliet 1 og glasvævet sammenlamineres i en kontinuerlig bevægelse.

25

30

Når banerne er bevæget væk fra valserne, ville disse være sammenlamineret og fremføres ind mellem to samvirkende trykflader 7, 8, der er udformet med kølemidler.

Kølemidlerne vil over en tidsperiode på eksempelvis 0.1 sekund afkøle kompositten til en temperatur på omkring 50°C under tryk.

- 5 Kompositten vil afslutningsvis blive oprullet på rullen 10.

Det er underforstået, at der kan designes mange forskellige typer apparater til udøvelse af opfindelsen.

10

Eksempelvis kan nævnes, at det stiplede korresponderende trykfladearrangement kan udelades.

K R A V

1. Fremgangsmåde til fremstilling af et komposit produkt
5 omfattende mindst ét lag forstærkende vævsmateriale samt
mindst ét lag PTFE-folie eller ePTFE-folie, idet foliet
eller folierne sammenlamineres med laget eller lagene af
vævsmateriale under opvarmning og tryk
- 10 k e n d e t e g n e t v e d, at kompositmaterialet
efterfølgende afkøles helt eller delvist i en fikseret
tilstand.
2. Fremgangsmåde ifølge krav 1, k e n d e t e g n e t
15 v e d, at afkølingen foretages over en tidsperiode på
tilnærmelses 0,1 - 240 sekunder fra en temperatur på 300-
420 °C, fortrinsvis 20 - 120 sekunder fra en temperatur
på 380-400 °C, til en temperatur på tilnærmelses 50 °C.
- 20 3. Fremgangsmåde ifølge krav 1 eller 2, k e n d e t e g -
n e t v e d, at kompositmaterialet udsættes for et
træk under afkølingen
4. Fremgangsmåde ifølge krav 1-3, k e n d e t e g n e t
25 v e d, at kompositmaterialet udsættes for en kombineret
afkøling og trykpåvirkning af midler til trykpåvirkning.
5. Fremgangsmåde ifølge krav 1-4, k e n d e t e g n e t
v e d, at midlerne til trykpåvirkning er udformet med
30 køllemidler.
6. Fremgangsmåde ifølge krav 1-5, k e n d e t e g n e t
v e d, at trykpåvirkningen udøves kontinuerligt ved hjælp
af midler til trykpåvirkning i form af mindst én valse.

7. Fremgangsmåde ifølge krav 1-6, k e n d e t e g n e t v e d, at trykpåvirkningen udøves stepvist ved hjælp af midler til trykpåvirkning i form af en trykflade.
- 5 8. Fremgangsmåde ifølge krav 1-7, k e n d e t e g n e t v e d, at afkøle kompositmaterialet under et i hovedsagen uniformt tryk over fladen ved hjælp af en afkølingsflade.
- 10 9. Komposit produkt fremstillet i henhold til kravene 1-8, k e n d e t e g n e t v e d, at produktet omfatter mindst ét folielag af PTFE eller ePTFE-folie, samt mindst et lag forstærkende væv.
- 15 10. Komposit produkt ifølge krav 9, k e n d e t e g n e t v e d, at det forstærkende væv udgøres helt eller delvist af glasvæv eller PTFE-coated glasvæv.
- 20 11. Apparat til fremstilling af et komposit materiale omfattende mindst ét lag forstærkende vævsmateriale samt mindst ét lag PTFE-folie eller ePTFE-folie, idet foliet eller folierne sammenlamineres med laget eller lagene af glasvæv under opvarmning og tryk, idet apparatet omfatter midler til sammenlaminering af kompositmaterialet under en kombineret tryk- og varmepåvirkning,
- 25 k e n d e t e g n e t v e d, at apparatet yderligere omfatter midler til fiksering af det uafkølede eller kun delvist afkølede kompositmateriale og med disse midler samvirkende styrbare kølemidler.
- 30 12. Apparat ifølge krav 11, k e n d e t e g n e t v e d, at apparatets midler til fiksering og samvirkende styrbare kølemidler omfatter mindst én trykflade med integrerede kølemidler.

13. Apparat ifølge krav 11, k e n d e t e g n e t v e d,
at apparatets midler til fiksering og samvirkende
styrbare kølemidler omfatter mindst én valse med
integrerede kølemidler.

SAMMENDRAG

- Opfindelsen angår en fremgangsmåde til fremstilling af et komposit produkt omfattende mindst ét lag forstærkende vævsmateriale samt mindst ét lag PTFE-folie eller ePTFE-folie, idet foliet eller folierne sammenlamineres med laget eller lagene af glasvæv under opvarmning og tryk, idet kompositmaterialet efterfølgende afkøles helt eller delvist i en fikseret tilstand.
- 10 Ifølge en foretrukken udførelsesform, fikseres kompositten ved hjælp af en eller to samvirkende trykflader under et relativt højt tryk.
- 15 Ifølge opfindelsen opnås et formstabilt kompositmateriale med et stærkt forøget E-modul.
